**Quick setup — if you've done this kind of thing before**

Set up in Desktop or HTTPS SSH https://github.com/handough/cmpt220dougherty.git

We recommend every repository include a README, LICENSE, and .gitignore.

**...or create a new repository on the command line**

```
echo "# cmpt220dougherty" >> README.md
git init
git add README.md
git commit -m "first commit"
git remote add origin https://github.com/handough/cmpt220dougherty.git
git push -u origin master
```

**...or push an existing repository from the command line**

```
git remote add origin https://github.com/handough/cmpt220dougherty.git
git push -u origin master
```

### Setup Java

The first step is to install Java in your computer if you have not previously done so. If you don't know if Java is installed in your computer, you can check from a command window. For Windows users, if you are not familiar with the command prompt window, you can find some help [here](#). For Mac OS users, you can find some help [here](#).

To check if Java is installed on your machine, you can issue the following command:

```
java -version
```

If Java is installed, this command will output the version of Java that is installed on your computer. If you are not sure how to run a command, you can find some help [here](#) and add it to your documentation.

To test if your machine has Java installed, you can run the following command:

```
javac -version
```

Again, if the command returns an error, you can find some help [here](#) and add it to your documentation.

```
